Abstracts

Rabies vaccine for humans is a biological preparation administered to prevent rabies, a fatal viral disease transmitted through the saliva of infected animals, typically via bites or scratches. The vaccine works by stimulating the immune system to produce antibodies against the rabies virus, providing pre-exposure prophylaxis for high-risk groups (such as veterinarians, laboratory workers, and travelers to endemic regions) and post-exposure prophylaxis following potential exposure. It is an inactivated vaccine, often delivered in a multi-dose series, and is considered essential in public health strategies for controlling and eliminating human rabies deaths, particularly in regions where the virus is endemic and access to timely medical care is limited.

The global Rabies Vaccine For Humans market size was estimated at USD 1345.65 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
