Abstracts

The working principle of Rad hard operational amplifiers is similar to that of ordinary operational amplifiers. They also have the functions of input signal amplification, operational processing and feedback control. They usually have two input terminals, called the positive input terminal and the negative input terminal. When the input voltage at the positive input terminal is higher than the negative input terminal, the output voltage of the operational amplifier will become a positive voltage; otherwise, it will become a negative voltage. In addition, radiation-resistant operational amplifiers can also perform various operational processing such as addition, subtraction, multiplication, division, integration, and differentiation, which are realized through feedback loops.

The global Rad Hard Operational Amplifiers market size was estimated at USD 587.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
