## Abstracts

Radar absorbing materials (RAMs) are engineered substances designed to reduce the radar cross-section (RCS) of objects by absorbing and dissipating electromagnetic energy rather than reflecting it back to the radar system, thereby minimizing detectability across various frequency bands. These materials function through principles such as dielectric loss, magnetic loss, or a combination of both, and are typically applied as coatings, structural composites, or specialized tiles in military, aerospace, and increasingly in civilian sectors like autonomous vehicles and telecommunications infrastructure. Key characteristics include broadband absorption performance, lightweight properties, durability under extreme environmental conditions, and adaptability to complex geometries, making them critical for stealth technology and electromagnetic compatibility applications.

The global Radar Absorbing Materials market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
