Abstracts

Radar cross section (RCS) test equipment is a type of specialized measuring instrument system that mainly transmits radar signals of known power and frequency in a fully anechoic chamber or a compact field, receives the reflected echo from the target object, and then amplifies, filters, and processes the signal through Fourier transform, and finally obtains the equivalent radar cross section curve of the target at different incident angles and frequencies. These devices usually include high-performance radar transceiver antennas, precision rotation and positioning platforms, data acquisition and control software, and automated post-processing systems. They are key test tools in the fields of aerospace, defense stealth technology evaluation, antenna and radar system research and development, and high-end automotive autonomous driving radar calibration.

The global Radar Cross Section (RCS) Test Device market size was estimated at USD 131.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.10% during the forecast period.
