## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Radar Tachometer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Radar Tachometer production reached approximately 24.7 k units, with an average global market price of around US\$ 3500 per unit. Radar Tachometer is a device that uses the Doppler effect of electromagnetic waves to measure the flow velocity of water. It emits radar beams onto the surface of the water and receives the reflected echoes, then analyzes the Doppler shift of these echoes to calculate the water flow velocity. This technology enables non-contact measurement, avoiding the interference that traditional measurement methods may cause, and is suitable for various aquatic environments such as rivers, lakes, and oceans. Radar Tachometer, with advantages of non-contact measurement, high precision, and strong environmental adaptability, are gaining traction in smart water management and extreme weather monitoring, gradually replacing traditional contact-based devices in rivers and urban drainage. Future growth will hinge on IoT integration and multi-parameter capabilities, though challenges remain in cost competition and data reliability under complex weather conditions.

The global Radar Tachometer market size was estimated at USD 86.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Radar Tachometer market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
