Abstracts

Radial sliding bearings, also known as journal bearings or plain bearings, are mechanical components designed to support rotating shafts by providing a sliding surface between the shaft and the bearing housing, where the load is applied perpendicular to the axis of rotation. Unlike rolling-element bearings, which use balls or rollers, radial sliding bearings operate on the principle of hydrodynamic or boundary lubrication, relying on a thin film of lubricant to minimize friction and wear between the stationary bearing surface and the rotating shaft. These bearings are typically constructed from materials such as babbitt metal, bronze, polymers, or composites, chosen for their wear resistance, conformability, and compatibility with various operating conditions. Key characteristics include their ability to handle high loads, dampen vibrations, accommodate misalignment, and operate quietly, making them suitable for applications where durability, shock absorption, and low maintenance are critical, such as in heavy machinery, automotive engines, turbines, and industrial equipment.

The global Radial Sliding Bearing market size was estimated at USD 2450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
