Abstracts

Radial supercapacitors, also known as electric double-layer capacitors (EDLCs), are a type of electrochemical energy storage device distinguished by their cylindrical, radial-leaded design, which facilitates through-hole mounting on printed circuit boards (PCBs). These components store energy electrostatically at the electrode-electrolyte interface, enabling rapid charge and discharge cycles, high power density, and exceptional cycle life compared to batteries. They are characterized by their radial orientation, where both terminals extend from the same end of the cylindrical body, making them suitable for automated assembly processes and space-constrained applications. Unlike axial supercapacitors, their design optimizes board space utilization and mechanical stability, and they are commonly used for backup power, peak power assistance, and energy harvesting in electronics, industrial systems, and automotive applications.

The global Radial Supercapacitors market size was estimated at USD 150.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
