Abstracts

A radiant cooling system is a type of building climate control technology that cools indoor spaces primarily by absorbing heat through surfaces such as floors, ceilings, or walls, where chilled water circulates through embedded pipes, reducing air temperature via radiant heat exchange rather than relying solely on forced air circulation; this method enhances thermal comfort by minimizing temperature stratification, drafts, and noise, while also improving energy efficiency by leveraging higher chilled water temperatures and integrating effectively with low-energy systems like geothermal heat pumps or solar cooling.

The global Radiant Cooling System market size was estimated at USD 1250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
