Abstracts

Radiation cooling coatings are advanced materials engineered to reflect solar radiation and emit thermal energy in the atmospheric transparency window (8-13 μ m), enabling sub-ambient cooling without external energy input. These coatings typically consist of polymer matrices embedded with inorganic nanoparticles such as titanium dioxide, silicon dioxide, or barium sulfate which enhance solar reflectance and mid-infrared emissivity. Applied to building roofs, industrial equipment, and transportation surfaces, they reduce cooling loads, lower energy consumption, and mitigate urban heat island effects. Key performance metrics include solar reflectance (SR) values often exceeding 0.9 and thermal emittance above 0.85, with formulations increasingly optimized for durability, weather resistance, and compatibility with various substrates.

The global Radiation Cooling Coating market size was estimated at USD 125.47 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.30% during the forecast period.
