Abstracts

Radiation cured adhesives are a category of specialty adhesives that polymerize and cure upon exposure to specific types of radiation, primarily ultraviolet (UV) light or electron beam (EB) radiation, forming strong, durable bonds without the need for heat, solvents, or extended drying times. These adhesives are formulated with photoinitiators that absorb energy from the radiation source, triggering a rapid cross-linking reaction that solidifies the material within seconds, making them ideal for high-speed manufacturing processes, precision bonding applications, and industries requiring cleanroom compatibility, such as electronics, medical devices, optics, and automotive assembly, where fast curing, low volatile organic compound (VOC) emissions, and precise control over bond line properties are critical advantages.

The global Radiation Cured Adhesives market size was estimated at USD 1450.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
