Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Radiation-Hardened Erbium-Doped Fiber competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of radiation-hardened erbium-doped optical fiber will reach 1.26 million meters, with an average selling price of US\$40 per meter. Radiation-hardened erbium-doped fiber (R-doped erbium-doped fiber) is a type of erbium-doped gain or active fiber designed for high-radiation environments. Through material formulation (such as pure silica/fluorine-doped or nitrogen-doped silica substrates), doping and annealing techniques, specialized coatings, and low-loss manufacturing processes, R-doped erbium-doped fiber significantly reduces radiation-induced absorption and gain degradation, thereby ensuring that amplifier/optical system performance is maintained after cumulative ionizing doses or transient radiation events. This type of fiber offers multiple product lines, including polarization-maintaining and non-polarization-maintaining, single-core/double-clad, and Er/Yb co-doped. It is commonly used in space-grade fiber amplifiers, optical frequency combs, sensor links, and nuclear/aerospace measurement equipment.

The global Radiation-Hardened Erbium-Doped Fiber market size was estimated at USD 50.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
