Abstracts

Radiation imaging systems are non-invasive diagnostic and inspection tools that utilize various forms of radiation?such as X-rays, gamma rays, or neutrons?to create detailed images of internal structures, materials, or objects, with key applications spanning medical diagnostics (e.g., radiography, CT scans), industrial non-destructive testing (e.g., weld inspection, aerospace component analysis), and security screening (e.g., baggage scanning, cargo inspection). These systems function by detecting differences in how radiation interacts with materials of varying densities and compositions, enabling visualization of flaws, anomalies, or anatomical features without physical intrusion. Technological advancements, including digital detectors, AI-enhanced image processing, and portable designs, continue to expand their capabilities, precision, and accessibility across sectors.

The global Radiation Imaging System market size was estimated at USD 1850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
