Abstracts

Radiation protection windows are specialized architectural elements designed to shield occupants from harmful ionizing radiation, typically constructed with lead glass or composite materials that incorporate high-density metals such as lead, tungsten, or bismuth to attenuate radiation while maintaining visibility. These windows are engineered to meet specific attenuation requirements based on the type and energy level of radiation encountered, commonly used in medical facilities (e.g., radiology departments, nuclear medicine, and radiotherapy suites), industrial settings (e.g., non-destructive testing and nuclear power plants), and research laboratories to ensure safety compliance and operational efficiency. The performance of such windows is measured in terms of lead equivalence (mm Pb), and they must adhere to stringent international standards and regulations governing radiation safety, often requiring customization in size, framing, and shielding capacity to align with the architectural and protective needs of the installation environment.

The global Radiation Protection Window market size was estimated at USD 315.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
