Abstracts

Radiation protective aprons are specialized garments designed to shield healthcare professionals, patients, and other personnel from harmful ionizing radiation exposure during diagnostic imaging procedures such as X-rays, fluoroscopy, and interventional radiology. These aprons are typically constructed from lead or lead-equivalent composite materials, which are dense enough to attenuate radiation, and are available in various designs?including full-wrap, skirt-and-vest, and thyroid collars?to provide targeted protection for vital organs while balancing wearer comfort and mobility. Their effectiveness is measured in terms of lead equivalence (e.g., 0.25 mm to 0.5 mm Pb), and modern iterations increasingly incorporate lightweight, non-lead materials like bismuth or antimony for improved ergonomics and environmental safety.

The global Radiation Protective Aprons market size was estimated at USD 369.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
