## Abstracts

Radiation Resistant LED Lighting refers to lighting equipment that uses light-emitting diodes as light sources and, through special design and technical processing, enables it to work stably and long-term in high-radiation environments (such as nuclear power plants, nuclear waste treatment facilities, medical radiation areas, scientific research radiation environments, etc.). LED lighting itself is a semiconductor solid-state light-emitting device that uses solid semiconductor chips as light-emitting materials. In the semiconductor, excess energy is released through carrier recombination, causing photon emission, directly emitting red, yellow, blue, and green light, and can emit light of any color by adding phosphors. On this basis, radiation-resistant LED lighting further enhances its radiation resistance to ensure the performance stability and service life of the light source in a radiation environment.

The global Radiation Resistant LED Lighting market size was estimated at USD 193.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
