Abstracts

Radiation Shielded Lead Door is a specialized barrier designed to protect individuals from harmful ionizing radiation in environments where diagnostic imaging, radiation therapy, or nuclear procedures are performed. Constructed with an internal lead core of varying thickness—typically ranging from 1 mm to several millimeters depending on the shielding requirements—these doors provide effective attenuation of X-rays and gamma rays. The lead sheet is typically encased within materials such as steel, wood, or laminate to provide structural support and aesthetic integration while maintaining safety standards. Radiation shielded lead doors are manufactured to meet strict regulatory guidelines and are often equipped with features such as leaded vision panels, automatic sliding or swinging mechanisms, and electromagnetic locking systems to enhance both usability and protection.

The global Radiation Shielded Lead Door market size was estimated at USD 145.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.20% during the forecast period.
