Abstracts

Radiation tolerant cameras are specialized imaging devices engineered to withstand and function in high-radiation environments, such as nuclear power plants, medical radiation therapy facilities, space exploration missions, and particle accelerators, where conventional cameras would suffer rapid degradation or failure due to ionizing radiation damaging their electronic components and image sensors; these cameras incorporate radiation-hardened materials, shielding techniques, and design modifications?such as the use of sapphire or quartz windows, rad-hard complementary metal-oxide-semiconductor (CMOS) sensors, and error-correction circuitry?to maintain operational integrity, image quality, and longevity under cumulative radiation doses that could otherwise cause latch-up, single-event upsets, or total functional failure in standard imaging equipment.

The global Radiation Tolerant Camera market size was estimated at USD 48.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.35% during the forecast period.
