Report Overview

Radiative cooling paint is an innovative type of coating designed to reflect sunlight and emit infrared radiation, thereby reducing the temperature of surfaces to which it is applied. This paint works by reflecting a significant portion of the sun's rays, including visible and ultraviolet light, while simultaneously emitting heat as infrared radiation. This dual action allows surfaces coated with radiative cooling paint to remain cooler than their surroundings, even under direct sunlight. The technology has potential applications in reducing the energy consumption of buildings by lowering the need for air conditioning, thus contributing to energy efficiency and mitigating urban heat island effects.
