Report Overview

Radiative cooling technology is an innovative passive cooling method that allows objects to release heat by emitting infrared radiation, which passes through the atmosphere and into outer space. This process can cool surfaces below ambient air temperatures without using electricity or active cooling systems. The technology typically involves materials or coatings that reflect sunlight while efficiently radiating heat in the infrared spectrum, making it particularly effective in hot and sunny climates. Radiative cooling has potential applications in building temperature regulation, improving energy efficiency, reducing reliance on air conditioning, and enhancing the performance of solar panels by keeping them cool.
