Abstracts

Radio Direction Finder is an instrument that intercepts and uses electromagnetic radiation in the radio portion of the spectrum to determine the direction of the radio transmitter. A direction finder (DF) can be used by an aircraft or ship as a navigational aid. This is accomplished by measuring the direction (bearing) of at least two transmitters whose locations are already known. When the measured directions from each transmitter are plotted on a map, the intersection of the two plotted lines gives the location of the aircraft or ship carrying the DF. This technique, using the directions to two or more transmitters of known location, is called triangulation. Global key players of Radio Direction Finder (RDF) include Rohde-schwarz and Collins Aerospace (RTX), etc. The top five players hold a share about 70%. Rohde-schwarz is the largest manufacturers of Radio Direction Finder (RDF) in the world, has a share about 50%. Asia-Pacific is the largest market, has a share about 30%. In terms of product type, Single-channel is the largest segment, occupied for a share of about 55%, and in terms of application, Air Traffic Control has a share about 63 percent.
