Abstracts

Radio frequency identification (RFID) in retail uses electromagnetic radio-frequency to transfer data from a tag attached to an object through the utilization of a wireless scan system. It is mainly employed for automatic identification and tracking purposes. RFID tags carry unique product numbers, which are attached to the product. If the consumer buys and pays for that product or good with a credit or debit card the shop keepers can link the purchases to the recorded RFID data and use the recorded data for marketing information to figure out individual consumers' behavior through a store. This kind of data helps the retail sector to make improvements, such as by contributing to optimize a store's inventory to anticipate consumer behavior. Manually scanning and counting the inventory is resource intensive, RFID can help in identifying the inventory and can track products easily. It improves the employees' efficiency and helps in inventory management. It provides security from store theft, the products have a tag if not removed from the product at payment counter, it raises alarm while leaving the shop. The global radio frequency identification in the retail market is expected to progress at a steady growth rate over the forecast period.
