### Report Overview

Radio modems transfer data wirelessly across a range of up to tens of kilometres. Using radio modems is a modern way to create Private Radio Networks (PRN). Private radio networks are used in critical industrial applications, when real-time data communication is needed. Radio modems enable user to be independent of telecommunication or satellite network operators. In most cases users use licensed frequencies either in the UHF or VHF bands. In certain areas licensed frequencies may be reserved for a given user, thus ensuring that there is less likelihood of radio interference from other RF transmitters. Also licence free frequencies are available in most countries, enabling easy implementation, but at the same time other users may use the same frequency, thus making it possible that a given frequency is blocked. Factors influencing radio performance are: antenna height and type, the sensitivity of the radio, the output power of the radio and the complete system design.

In Europe, Radio Modem key players include Digi, Campbell Scientific, SATEL, RACOM, RF DataTech, etc. Europe top five manufacturers hold a share over 50%. Germany is the largest market, with a share over 20%.

In terms of product, UHF is the largest segment, with a share over 40%. And in terms of application, the largest application is Transportation, followed by Government and Defense.
