Abstracts

A radio repeater is a key device used to extend the range of wireless communications. It receives, amplifies, and retransmits wireless signals to overcome attenuation and obstacles in signal transmission, ensuring reliable transmission of signals over long distances or in complex environments. The repeater receives weak signals from the transmitter and enhances the signal strength through a built-in amplifier. The amplified signal is retransmitted through the antenna to continue the signal transmission path. Some repeaters support inter-frequency relaying, using different frequencies for reception and transmission to avoid interference.

The global Radio Repeater market size was estimated at USD 4306.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
