Abstracts

Radioactive material logistics is used in medicine, power generation, research and manufacturing, and by the military. Like other products and materials, radioactive material is shipped from one location to another. All shipments of radioactive material must be packaged and transported according to strict federal regulations. Markings on containers and vehicles explain the contents of each package using standard terms, codes and internationally recognized symbols. The increasing demand for medical oxygen in hospitals has resulted in a greater need for transportation. Additionally, clinical waste such as nuclear medicine, virus samples, healthcare hazardous materials, and surgical equipment must be transported. The increasing need to transport lithium batteries coupled with the already established gas and oil industries in the region will increase the need for hazardous material logistics.

The global Radioactive Material Logistics market size was estimated at USD 1788.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
