Abstracts

Radioactive measurement instruments are precision instruments used to detect, record and measure the type, quantity, energy, change over time and spatial distribution of radiation emitted by radionuclides. Radioactive measurement instruments are devices that qualitatively or quantitatively detect radiation emitted by radioactive isotopes (such as α rays, β rays, γ rays, etc.). Radioactive measuring instruments usually consist of detectors and subsequent electronic circuits. The detector is the core component, responsible for converting the energy of radiation into electrical signals such as voltage, current, and charge pulses for subsequent electronic circuits to analyze, process, and record. Radioactive measuring instruments use the ionization and excitation effects generated by the interaction of radiation emitted by radioactive isotopes with matter, capture these effects through detectors, and convert them into measurable electrical signals, thereby achieving the measurement of radioactivity.

The global Radioactivity Measuring Instruments market size was estimated at USD 2850.62 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
