## Abstracts

Radioactivity testing for building materials refers to the process of measuring and evaluating the content of natural radionuclides (primarily uranium-238, thorium-232, and potassium-40) in building materials such as stone, concrete, bricks, and gypsum boards using professional instruments (such as gamma spectrometers and radon detectors). The purpose is to determine whether the materials release excessive amounts of radioactive radon gas or gamma radiation to ensure that they do not pose a hazard to human health during use in buildings and to ensure a safe indoor environment. Test results are usually based on national standards.

The global Radioactivity Testing of Building Materials market size was estimated at USD 1058.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
