Abstracts

A radiochemistry PET cyclotron is a specialized particle accelerator designed for the production of positron-emitting radioisotopes, such as Fluorine-18, Carbon-11, and Oxygen-15, which are essential for positron emission tomography (PET) imaging in medical diagnostics and research. These compact, self-shielded systems are typically installed within hospital or research facility environments to enable on-site synthesis of short-lived radiopharmaceuticals, ensuring timely availability for clinical procedures. The core function involves accelerating charged particles (typically protons) to bombard stable target materials, inducing nuclear reactions that generate radionuclides with specific decay properties suitable for PET tracers. Key features often include automated chemistry modules for rapid purification and formulation, radiation shielding for operator safety, and integration with quality control systems to meet regulatory standards for pharmaceutical production. These cyclotrons represent a critical link in the molecular imaging chain, supporting applications in oncology, neurology, and cardiology by providing high-purity radiotracers with minimal logistical delay.

The global Radiochemistry Pet Cyclotron market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
