Report Overview:

A radiofrequency ablation is a minimally invasive procedure that destroys the nerve fibers carrying pain signals to the brain. It can provide lasting relief for people with chronic pain, especially in the lower back, neck and arthritic joints.

Radiofrequency ablation, also called rhizotomy, is a nonsurgical, minimally invasive procedure that uses heat to reduce or stop the transmission of pain. Radiofrequency waves ablate, or "burn," the nerve that is causing the pain, essentially eliminating the transmission of pain signals to the brain.

This procedure is most commonly used to treat chronic pain and conditions such as arthritis of the spine (spondylosis) and sacroilitis. It is also used to treat neck, back, knee, pelvic and peripheral nerve pain. The benefits of radiofrequency ablation include avoiding surgery, immediate pain relief, little to no recovery time, decreased need for pain medication, improved function, and a quicker return to work and other activities.

The Global Radiofrequency Ablation for Pain Management Market Size was estimated at USD 305.34 million in 2023 and is projected to reach USD 540.93 million by 2029, exhibiting a CAGR of 10.00% during the forecast period.
