### Report Overview:

Electrosurgery is the use of high energy alternating current to increase intracellular temperature in order to achieve vaporization or combination of desiccation and protein coagulation of biological tissue. Electrosurgical devices are used to perform coagulation, fulguration, desiccation, tissue ablation, and cutting procedures. This is carried out by conversion of electromagnetic energy into kinetic energy inside the tissue of biological cell, which is further converted into thermal energy providing desired effect. Electrosurgical devices are used in general surgery, cardiology, urology, gynecology, cosmetology, and dermatology. Radiofrequency devices are used in surgical procedures which use high frequency current, viz. frequency above 1000 kHz that transmits radio signal to perform tissue desiccation and protein coagulation.

The Global Radiofrequency Electrosurgical Device Market Size was estimated at USD 955.00 million in 2023 and is projected to reach USD 1507.06 million by 2029, exhibiting a CAGR of 7.90% during the forecast period.
