Abstracts

Radiogardase is an oral antidote, the main ingredient of which is ferric ferrocyanide. It is used to treat or prevent radioactive cesium and thallium poisoning, and is used in nuclear accident emergency or thallium poisoning treatment. Prussian blue combines with metal ions such as cesium and thallium through the cyanide in the crystal lattice to form a stable compound, preventing it from being absorbed by the intestine. The combined complex is excreted from the body through feces, reducing the accumulation of radioactive or toxic substances in the body.

The global Radiogardase market size was estimated at USD 122.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
