Abstracts

Radiopharmaceutical freeze-dried products are solid dosage forms of radioactive drugs created through lyophilization (freeze-drying). This process involves freezing the drug and then removing its water content in a vacuum, resulting in a stable powder or pellet that can be stored for extended periods. When needed for diagnostic or therapeutic use, the product is reconstituted by adding a specific solvent, which returns it to a liquid state. This method is particularly crucial in nuclear medicine due to the short half-life of many radiopharmaceuticals, making it a reliable solution for their transportation and storage.

The global Radiopharmaceutical Freeze-Dried Products market size was estimated at USD 366.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
