Abstracts

Radiosynthesis equipment refers to specialized automated systems designed for the synthesis of radiolabeled compounds, primarily used in the production of radiopharmaceuticals for positron emission tomography (PET) and single-photon emission computed tomography (SPECT) imaging. These systems integrate chemical synthesis modules, reagent handling, purification components, and radiation shielding to facilitate the safe and efficient preparation of short-lived radioactive tracers, such as fluorine-18, carbon-11, or technetium-99m labeled molecules, under controlled and reproducible conditions. The equipment is critical for enabling research, clinical diagnostics, and drug development by providing high-purity radiotracers with consistent quality, often featuring user-friendly software interfaces, disposable cassettes or kits to minimize cross-contamination, and compliance with regulatory standards for radiopharmaceutical manufacturing.

The global Radiosynthesis Equipment market size was estimated at USD 62.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.15% during the forecast period.
