Abstracts

Radiotherapy instruments, also known as radiation therapy systems, are medical devices that utilize ionizing radiation—primarily high-energy X-rays, gamma rays, electron beams, or proton beams—to target and destroy cancerous cells or shrink tumors while minimizing damage to surrounding healthy tissues. These instruments include both external beam radiotherapy machines, such as linear accelerators (LINACs), and internal radiotherapy systems, like brachytherapy devices, which deliver radiation from within or close to the tumor site. Advanced features often integrated into modern systems include image-guided radiotherapy (IGRT), intensity-modulated radiotherapy (IMRT), stereotactic radiosurgery (SRS), and adaptive radiotherapy, enabling highly precise dose delivery tailored to individual patient anatomy and tumor characteristics. The primary goal of radiotherapy instruments is to provide effective, non-invasive or minimally invasive cancer treatment, either as a standalone therapy or in combination with surgery, chemotherapy, or immunotherapy, thereby playing a critical role in comprehensive oncology care.

The global Radiotherapy Instrument market size was estimated at USD 7450.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
