Report Overview

Radiotherapy patient positioning devices are essential tools used in radiation therapy to ensure precise and consistent positioning of patients during treatment. These devices are designed to immobilize and stabilize specific parts of the body, allowing for accurate targeting of tumors while minimizing radiation exposure to surrounding healthy tissues. Common types of positioning devices include headrests, body molds, thermoplastic masks, and vacuum cushions, each tailored to fit the patient's anatomy and the specific treatment area. By maintaining the patient in a fixed and reproducible position, these devices enhance the effectiveness of radiotherapy, reduce treatment times, and improve overall patient safety and comfort. The use of advanced imaging techniques and customizable materials in these devices further optimizes treatment accuracy, contributing to better clinical outcomes in cancer care.
