Abstracts

A rainfall simulator is a device or system used to simulate and study rainfall patterns and their effects on various surfaces, such as soil, vegetation, and structures. It is commonly used in agricultural research, soil erosion studies, hydrological modeling, and engineering design. The simulator typically consists of a controlled water source, a distribution system to evenly distribute the water, and a set of nozzles or sprinklers to generate rainfall. The rainfall intensity and duration can be adjusted to mimic different rainfall events. By using a rainfall simulator, researchers can study the impact of rainfall on soil erosion, infiltration rates, runoff patterns, and the effectiveness of various erosion control measures. It allows for controlled experiments and observations, providing valuable data for understanding and managing water resources, soil conservation, and land management practices.

The global Rainfall Simulator market size was estimated at USD 207.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.60% during the forecast period.
