Abstracts

Rainfall type Meteorological Index Insurance is a form of weather-based insurance that provides coverage based on the amount of rainfall recorded, rather than actual losses incurred by the insured party. It is typically used in agriculture, where rainfall levels are a critical determinant of crop yields. Instead of conducting individual loss assessments, payouts are triggered when rainfall measurements, recorded at specific weather stations, fall below or exceed predefined thresholds. This type of insurance helps farmers and other stakeholders manage the financial risks associated with droughts or excessive rainfall, offering quicker payouts and reducing administrative costs. The Rainfall Type Meteorological Index Insurance market is emerging as a critical risk mitigation tool in agriculture, particularly in regions vulnerable to climate variability and unpredictable rainfall patterns. Unlike traditional indemnity-based insurance, this model offers quicker payouts and lower administrative costs by using predefined rainfall thresholds as the trigger for compensation. Its appeal lies in its transparency and scalability, making it suitable for both smallholder farmers and large agribusinesses. The market is supported by growing collaboration between insurers, governments, and development organizations aiming to enhance climate resilience. However, challenges such as basis risk, data availability, and farmer awareness continue to shape the pace and structure of market adoption.

The global Rainfall type Meteorological Index Insurance market size was estimated at USD 3272.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 14.90% during the forecast period.
