Report Overview

Rainscreen siding is a type of exterior cladding system that is designed to protect the underlying structure of a building from moisture damage. It consists of an outer layer of siding material, such as wood, fiber cement, or metal, that is separated from the building's wall by an air gap. This air gap allows for the circulation of air, which helps to prevent moisture buildup and allows any moisture that does penetrate the siding to evaporate. Rainscreen siding is commonly used in areas with high levels of rainfall or humidity to prevent water damage and mold growth. Currently, the typical models of Rainscreen siding include Trespa® Meteon, etc.
