Abstracts

Raman optical amplifier is an optical amplifier device that uses the Raman scattering effect to enhance the intensity of optical signals. Its working principle is to inject pump light (usually high-power laser) into the optical fiber, and amplify the signal light passing through with the help of the Raman scattering effect in the optical fiber. Compared with traditional optical amplifiers (such as erbium-doped optical amplifiers), Raman optical amplifiers have lower noise, wider gain bandwidth and good gain uniformity, and are widely used in long-distance optical fiber communication systems, signal amplification of optical fiber networks, and high-power fiber lasers.

The global Raman Optical Amplifier Board market size was estimated at USD 620.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
