Abstracts

Ramosetron hydrochloride is a selective 5-HT₃ receptor antagonist used primarily for the prevention and treatment of chemotherapy-induced nausea and vomiting (CINV) and postoperative nausea and vomiting (PONV). It functions by blocking serotonin receptors in the central and peripheral nervous systems, thereby reducing the emetic response triggered by cytotoxic drugs or surgical anesthesia. Compared to earlier generation antiemetics, ramosetron is noted for its higher receptor affinity, longer half-life, and potentially improved efficacy with a favorable side effect profile, particularly in terms of reduced risk of extrapyramidal symptoms. It is available in oral and injectable formulations, catering to both inpatient and outpatient settings, and is often positioned as a therapeutic option for patients who do not respond adequately to first-line treatments or require prolonged antiemetic coverage.

The global Ramosetron Hydrochloride market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
