Abstracts

The Rapid Plasma Reagin (RPR) test is a blood screening assay used to detect nonspecific antibodies produced in response to infection by *Treponema pallidum*, the bacterium responsible for syphilis; it operates as a flocculation test where carbon particles coated with cardiolipin-lecithin-cholesterol antigen aggregate visibly if reagin antibodies are present in the patient's serum, serving as an efficient, cost-effective tool for initial syphilis screening in both symptomatic individuals and at-risk populations during routine check-ups, prenatal care, and blood donor evaluations, though it requires confirmatory testing with treponemal-specific assays due to the possibility of false positives from other conditions such as autoimmune diseases, pregnancy, or recent vaccinations.

The global Rapid Plasma Reagin Test market size was estimated at USD 312.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
