Abstracts

Rare earth metals recycling refers to the process of recovering critical elements such as neodymium, dysprosium, praseodymium, and terbium from end-of-life products, industrial waste, and manufacturing byproducts. These elements are essential components in high-tech applications, including permanent magnets for electric vehicles and wind turbines, catalysts, batteries, and electronic devices like smartphones and hard drives. The recycling process typically involves collection, dismantling, mechanical and chemical separation, and purification to extract and refine these metals to a reusable form. Unlike primary mining, which is environmentally intensive and geographically concentrated, recycling offers a supplementary and more sustainable source, reducing reliance on raw ore extraction while addressing supply chain vulnerabilities and geopolitical dependencies.

The global Rare Earth Metals Recycling market size was estimated at USD 143.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Rare Earth Metals Recycling market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
