Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Rat Tail Suspension Test Device competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The Tail Suspension Test (TST) for mice and rats is a professional device based on the behavioral despair paradigm. It creates an unavoidable oppressive environment by fixing the tail of the experimental animal so that it is in an upside-down state. After the initial struggle, the animal will enter a "behavioral despair state" of intermittent limb immobility because it cannot escape. The proportion of its immobility time is quantified as an objective indicator for evaluating depressive-like behavior. The core of the device consists of a vertical suspension frame and a tail fixing clamp. The suspension frame is mostly made of metal or high-strength plastic, equipped with an adjustable hook to ensure that the animal's head is about 30 cm from the ground; the clamp usually uses medical tape or an automated tail hook, fixed 1-2 cm from the tip of the tail to avoid tissue damage. The entire experiment uses a video tracking system (such as VisuTrack software) to record the behavioral trajectory, and combines a dynamic tracking algorithm to distinguish between struggling (angular velocity > 30°/s) and static (movement amplitude
