Abstracts

Rate batteries generally refer to lithium-ion batteries, which are high-rate batteries that rely heavily on the movement of lithium ions between the positive and negative electrodes to work. The discharge rate of a lithium-ion battery refers to the current value required for the battery to discharge its rated capacity within a specified time. It is equal to the multiple of the rated capacity of the battery in terms of data value, usually represented by the letter C. For example, if the nominal rated capacity of the battery is 600mAh, it is 1C (1 rate), 300mAh is 0.5C, 6A (600mAh) is 10C, and so on. This report counts rate batteries used in the field of energy storage. Out to 2030, the global energy storage market is bolstered by an annual growth rate of 21% to 137GW/442GWh by 2030, according to BloombergNEF forecasts. In the same period, global solar and wind markets are expected to see compound annual growth rates of 9% and 7%, respectively. Much of the growth in energy storage investment is being driven by mandates and targeted subsidies, ranging from solar and wind co-location mandates in China, to the Inflation Reduction Act and state-level policies in the US. New support schemes are also emerging across Europe, Australia, Japan, South Korea, and Latin America.

The global Rate Batteries for Energy Storage market size was estimated at USD 64.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 27.90% during the forecast period.
