Report Overview

In 3D computer graphics, ray tracing is a technique for modeling light transport for use in a wide variety of rendering algorithms for generating digital images. On a spectrum of computational cost and visual fidelity, ray tracing-based rendering techniques, such as ray casting, recursive ray tracing, distribution ray tracing, photon mapping and path tracing, are generally slower and higher fidelity than scanline rendering methods. Thus, ray tracing was first deployed in applications where taking a relatively long time to render could be tolerated, such as still CGI images, and film and television visual effects (VFX), but was less suited to real-time applications such as video games, where speed is critical in rendering each frame.

The global Ray Tracing Technology market size was estimated at USD 311 million in 2023 and is projected to reach USD 4509.89 million by 2032, exhibiting a CAGR of 34.60% during the forecast period.

North America Ray Tracing Technology market size was estimated at USD 136.23 million in 2023, at a CAGR of 29.66% during the forecast period of 2024 through 2032.
