Abstracts

The sunlight in outer space is pure white light. When the sunlight passes through the earth's atmosphere, the light of each band scatters by colliding with suspended particles that are about 10 times smaller than the wavelength. Among them, blue light is scattered the most, so the sky you see when you look up is blue. At the same time, warm light is transmitted to the surface of the earth. This optical phenomenon is called Rayleigh scattering. When the white light of the lamp light source passes through the Rayleigh scattering plate, the micro-nano particles contained in the plate act similarly to the suspended particles in the earth's atmosphere. The white light is scattered on its surface, and finally the lamp presents the effect of blue sky, while the light passing through the Rayleigh scattering plate is warm white light. The ecological sunlight lighting system designed based on the Rayleigh scattering plate can make people feel like they are in nature and feel the extremely real blue sky and sunshine.
