## Abstracts

A Reaction Steam Turbine is a type of steam turbine where the rotor blades act as nozzles, and the expansion of steam occurs partially in the stationary nozzles and partially in the moving blades. This design uses both the reactive force of steam as it accelerates through the rotor blades and the pressure drop across both the stationary and moving blades to generate rotational motion. Reaction turbines are typically used in applications requiring high efficiency and smooth operation across a wide range of loads. The Reaction Steam Turbine market plays a significant role in industries focused on power generation, industrial processes, and mechanical drive applications. These turbines are widely used in utility-scale power plants, including thermal, nuclear, and geothermal plants, due to their high efficiency and adaptability to varying operational conditions.

**Key Market Drivers**

**Growing Energy Demand:** The rising global demand for electricity drives the adoption of efficient power generation technologies, including reaction turbines.

**Efficiency Requirements:** Reaction turbines are preferred for their ability to maintain high efficiency in multistage setups, making them suitable for large-scale power generation.
