Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Reactive Polyether Polyol competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Reactive polyether polyol is a class of polyether compounds terminated with reactive hydrogen-containing groups, primarily hydroxyl or amine groups, which enable them to react with isocyanates to form polyurethane structures. These polyols are synthesized by the polymerization of propylene oxide (PO) and/or ethylene oxide (EO) with various initiators such as glycerin, sorbitol, sucrose, or other polyhydric alcohols under basic catalysis. Their molecular weight, functionality (typically ranging from 2 to 6), and structure can be precisely controlled to suit specific application requirements. Reactive polyether polyols offer moderate viscosity, good flowability, and broad compatibility with processing technologies. They are essential raw materials for manufacturing flexible and rigid polyurethane foams, elastomers, coatings, adhesives, sealants, and various CASE (Coatings, Adhesives, Sealants, Elastomers) products. Depending on the performance needs, polyether polyols can be tailored through block copolymer design, high-functionality initiators, hydrophobic modifications, or bio-based raw materials. With the growing demand for eco-friendly and low-VOC polyurethane products, reactive polyether polyols are playing a key role in advancing sustainable polymer materials across industries such as construction, automotive, electronics, and consumer goods.

The global Reactive Polyether Polyol market size was estimated at USD 628.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
