## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Reactor Active Zone Device competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The reactor active region device is the core part of the nuclear reactor, mainly including fuel assemblies, control rods, coolant channels and structural materials, etc. It is the main area where nuclear fission reactions occur and energy is released. Its function is to maintain the controllability and stability of the chain fission reaction, while efficiently transferring the heat generated by fission. Different types of reactors (such as pressurized water reactors, boiling water reactors, fast neutron reactors, etc.) have different requirements for the structural design and material selection of the active region device to ensure reaction efficiency, safety and economy. With the development of nuclear energy technology, the reactor active region device is evolving towards higher safety, higher fuel utilization and stronger accident resistance. The new generation of reactors (such as the fourth-generation fast reactor, modular small reactor, molten salt reactor, etc.) emphasizes the use of advanced fuels, high-performance cladding materials and passive safety systems in the active region design to meet the needs of higher temperatures and longer operating cycles. At the same time, digital design and intelligent monitoring technology are also widely used in active region optimization and operation status management, promoting the development of nuclear power plants in a safer, more efficient and greener direction.

The global Reactor Active Zone Device market size was estimated at USD 5689.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.00% during the forecast period.
