Abstracts

Reagent grade elacridar refers to a high-purity chemical compound, specifically (R)-N-(4-(2-(3,4-dihydro-6,7-dimethoxyisoquinolin-2(1H)-yl)ethyl)phenyl)-9,10-dihydro-9,10-dioxo-2-anthracenesulfonamide, used primarily in laboratory and research settings to selectively inhibit P-glycoprotein (P-gp) and breast cancer resistance protein (BCRP), both key efflux transporters involved in multidrug resistance; this grade is characterized by stringent quality controls, including high-performance liquid chromatography (HPLC) purity verification, low endotoxin levels, and batch-to-batch consistency, ensuring reliability for in vitro and in vivo pharmacological studies, particularly in oncology, neurology, and drug disposition research where precise modulation of transporter activity is critical to experimental outcomes. The global market for reagent grade elacridar is niche but growing, driven by increasing research into overcoming multidrug resistance in cancer therapy, expanded use in blood-brain barrier permeability studies, and rising pharmaceutical R&D investments, with key consumers including academic institutions, pharmaceutical companies, and contract research organizations, particularly in North America, Europe, and Asia-Pacific regions where biomedical research infrastructure is advanced; however, the market faces constraints such as high costs of synthesis and purification, limited suppliers, and competition from alternative inhibitors, though demand is bolstered by the compound's irreplaceability in specific transporter inhibition applications and the trend toward personalized medicine approaches in oncology.

The global Reagent Grade Elacridar market size was estimated at USD 45.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
