Abstracts

A real-time dust monitor is an electronic instrument that continuously measures and reports airborne particulate matter (PM) concentrations, typically using laser scattering, beta attenuation, or light scattering technologies, to provide immediate data on pollutants such as PM1, PM2.5, PM10, and sometimes total suspended particulates (TSP) for environmental, occupational health, industrial process control, or regulatory compliance purposes. These devices often integrate with data logging, wireless transmission, and alert systems to enable proactive responses to air quality changes, distinguishing them from traditional gravimetric or manual sampling methods by delivering instantaneous, high-resolution measurements critical for dynamic monitoring in settings like construction sites, manufacturing facilities, urban air quality networks, and indoor environments.
